

TOKTWD 2024 – Sabba’s report

1. What did you hear, see, smell, and feel in the work environment on Nov. 6th? Use details

I saw many beakers and posters about brain and spinal cord injury research and treatment information. There were many microscopes and machines to help with the research. There were many different rooms to perform experiments and use the machines for different projects.

2. What about the environment would motivate you to wake up every day to attend work? Why?

The main reason why I would like to wake up and attend work every day would be my interest and love for neurology, how the brain and spine works and how you can use different machines every day to see how someone’s brain or spine looks and works, but another reason would be the design and layout of the workplace. It is modern and colorful, so it makes it welcoming.

3. What about the work environment you would find challenging? Why?

Something about the work environment that would be challenging would be how long it takes to do most of the experiments! I was watching my mom do a project and it took about 3 hours to do one small part of it, and because there are so many steps into every project. It is also far from my house in Coquitlam, and there is so much traffic in Downtown Vancouver so I would have to take the SkyTrain

4. What is ONE thing you found interesting about your workplace visit? Why?

A cool thing I found interesting about the workplace was that to get through most of the doors you would have to scan a keycard that only the employees have, on a little block that unlocks the door. I thought that was very cool and awesome. It is a surprisingly good security system for people that do not work at the workplace. I attached a photo of it so you can see what I mean a bit better. I also mentioned brain and spinal cord research, but that is also another interesting thing about the workplace.
